

### Butterfly Network

A butterfly network consists of  $(k+1) \cdot 2^k$  nodes, divided into  $k+1$  rows or ranks, each containing  $n=2^k$  nodes

Example:-

Nodes = 32 then  $(k+1) \cdot 2^k = 32$

$4 \cdot 8 = 32$

$(3+1) \cdot 2^3 = 32$ , that makes  $k=3$  so  $k+1=4$  rows or ranks of nodes( $\circ$ ) .

Rank 0	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$
Rank 1	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$
Rank 2	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$
Rank 3	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$	$\circ$

Let nodes  $(i, j)$  refer to the  $j^{\text{th}}$  node in  $i^{\text{th}}$  rank

where  $0 \leq i \leq k$  and  $0 \leq j \leq n$

#### Routing function

Node  $(i, j)$  of rank  $i > 0$  is connected to node  $(i-1, m)$ , where  $m$  is the integer formed by inverting the  $i^{\text{th}}$  bit of binary representation of  $j$ . And using same method node  $(i, m)$  is connected to  $(i-1, j)$ .

Say node  $(1, 0)$  gets connected to node  $(1-1, 100) = \text{node}(0, 4)$  and

node  $(1, 4)$  gets connected to node  $(1-1, 000) = \text{node}(0, 0)$

Pictorially the above two connections look like the following butterfly pattern :

Similarly node ( 1,1) gets connected to ( 1-1 , 101)= ( 0 , 5)

and ( 1 , 5) gets connected to ( 1 – 1, 001 ) = ( 0 , 1 )

node ( 1,2) gets connected to ( 1-1 , 110)= ( 0 , 6)

and ( 1 , 6) gets connected to ( 1 – 1, 010 ) = ( 0 , 2 )

node ( 1,3) gets connected to ( 1-1 , 111)= ( 0 , 7)

and ( 1 , 7) gets connected to ( 1 – 1, 011 ) = ( 0 , 3 )

Taking rank 2 node  $(2,0)$  gets connected to  $(2-1, 010) = (1, 2)$   
 and  $(2, 2)$  gets connected to  $(2-1, 000) = (1, 0)$   
 node  $(2, 1)$  gets connected to  $(2-1, 011) = (1, 3)$   
 and  $(2, 3)$  gets connected to  $(2-1, 001) = (1, 1)$   
 node  $(2,4)$  gets connected to  $(2-1, 110) = (1, 6)$   
 and  $(2,6)$  gets connected to  $(2-1, 100) = (1, 4)$

Taking rank 3 node  $(3,0)$  gets connected to  $(3-1, 001) = (2, 1)$

and  $(3, 1)$  gets connected to  $(3 - 1, 000) = (2, 0)$

node  $(3, 2)$  gets connected to  $(3-1, 011) = (2, 3)$

and  $(3, 3)$  gets connected to  $(3 - 1, 010) = (2, 2)$

node  $(3,4)$  gets connected to  $(3-1, 101) = (2, 5)$

and  $(3,5)$  gets connected to  $(3 - 1, 100) = (2, 4)$

node  $(3,6)$  gets connected to  $(3-1, 111) = (2, 7)$

and  $(3,7)$  gets connected to  $(3 - 1, 110) = (2, 6)$

Putting all the above three in the same diagram

As the rank number decreases the width of the wings of the butterflies increases exponentially. For this reason the length of the longest network edge increases as the number of network nodes increase.

The diameter of a butterfly network with  $(k+1) \cdot 2^k$  nodes is  $2k$

(Diameter, the maximum number of nodes through which a message must pass on its way from source to destination. Diameter measures the maximum delay in transmitting a message from one processor to another.)

Bisection width of a network of that size is  $2^{k-1}$

A butterfly network is used to route non-local memory to processors on BBNTC2000 multiprocessor
